

ABSTRACT

A hydraulic flushing system includes an indicia reader adapted to read indicia on a hydraulic fluid container and a data processor coupled to the indicia reader to determine if the indicia has been utilized before in the hydraulic flushing system. The hydraulic flushing system may include a pump to pump hydraulic fluid from the container. The data processor may prevent operation of the pump if the indicia has been utilized before in the hydraulic flushing system or if the indicia does not indicate a proper grade of hydraulic fluid for a type of vehicle being serviced.
